Water	066	(in case of 10m <sup>3</sup> of	f water per month for	
rates (JPY)	900	residential customers with 13mm diameter)		
Summary	(in case of 10m <sup>3</sup> of water per month for residential customers with 13mm diameter) After more than 30 years since its construction, the drainage treatment facility at the Samukawa Water Treatment Plant, the main water treatment plant of the Kanagawa Prefectural Enterprise Agency, had been due for renewal (Figure-1). Therefore, the PFI method (BTO method) was introduced for the renewal of the facility, utilizing private-sector know-how to (1) promote more efficient and effective facility development and operation, and (2) stabilize the recycling of dehydrated cakes generated from the treatment of drinking water sludge over the long term. <b>Output Output Output Output Distribution reservoir Distribution reservoir</b>			

PFI is a method of public works in which private-sector funds, management capabilities, and technical expertise (know-how) are utilized to design, construct, renovate, and renew public facilities, and to maintain, manage, and operate them.

In the Samukawa Water Treatment Plant Drainage Treatment Project, the prefectural government maintains, manages, and operates the water treatment facilities, while the PFI-contracted company designs, constructs, maintains, manages, and operates the drainage treatment facility based on the contract. The company also procures funds for the construction of the facility by obtaining loans from financial institutions (Figure 2).

Figure 2 Business scheme

In introducing the PFI project, a basic concept was formulated in FY2001, and a feasibility study was conducted to confirm the project was compatible with the PFI method.

After the announcement of its implementation policy, the statutory procedures were made such as VFM (Value for Money) evaluation and selection of the project undertaker through general competitive bidding. Subsequently, the project contract was concluded with a special purpose company (SPC), Samukawa Water Service Corporation, from December 2003 to the end of March 2026.

After the contract was signed, it took about two years to complete the construction of the dewatering machine and other facilities, and the PFI operator began operating the facility on April 1, 2006.

Currently, 20 years have passed since the contract was signed, and the project has achieved the above-mentioned objectives (1) and (2).

1. Current status (achievement level of PFI objectives)				
In the effectiveness verification conducted in FY 2012 for the PFI				
contract, its economic efficiency was proven through VFM evaluation				
(Table-1), and its effectiveness has been confirmed for efficient facility development and stable operation.				
(1) VFM evaluation				
Table 1 Comparison of Project Costs, VFM, etc.				
	When directly managed (PSC)	When implemented by PFI (PFI-LCC)		
(1) Preparation for construction	-	JPY174,229,000 (advisor fees, etc.)		
(2) Construction phase	JPY9,583,301,000 (design, construction, equipment, etc.)	JPY7,723,593,000 (design, construction, equipment, etc.)		
(3) Interest paid	JPY2,469,361,000	JPY3,410,490,000 (total installment interest for 20 years)		
(4) Installment payments	-	JPY11,117,759,000 (construction costs in (2) + (3))		
(5) Maintenance costs	JPY8,032,598,000	JPY8,303,188,000		
Total Simple sum of revenues and expenses	JPY20,085,260,000 ((2)+(3)+(5))	JPY19,611,500,000 ((1)+(2)+(3)+(5))		
Present Value	JPY14,008,895,000A	JPY13,080,342,000B		
VFM (present value)	-	JPY928,553,000 (A-B)		
<ul> <li>(2) Efficient facility maintenance</li> <li>The use of a short-time dehydrator has leveled out the sludge receiving load.</li> <li>The introduction of a filtration/concentrator has enabled the facility to cope with fluctuations in sludge concentration.</li> <li>The facility is equipped with a space for future use to improve the convenience of equipment renewal.</li> </ul>				
<ul> <li>(3) Stable operation Before the introduction of PFI, dewatered cakes used to be reused only as a raw material for cement, but after the introduction of PFI, they have been reused as gardening soil and ground soil in addition to cement raw material, thus securing multiple uses and sales channels (Figure 3).  The PFI contractor is contributing to the stable operation of the water treatment plant by responding to market fluctuations in the reuse of dehydration cakes.  They also have not defaulted on its services or reduced the service purchase fee by applying penalty clauses such as the control of the turbidity of returned water, which is stipulated in the contract.</li></ul>

	<u>2. Issues</u> Measures toward the end of the PFI project				
	With the expiration of the PFI contract, the existing facilities will be				
	taken over to a new management format while still operating, and the				
	operational know-how must be appropriately transferred between the				
	old and new management formats.				
	Actions loward the Termination of PFI Projects				
	In preparation for the termination of the PFI project at the end of				
	FY2025, the Agency established a study group within the Agency in				
	group will sort out the issues that have been raised so far, and properly				
Measures &	evaluate the project in reference to the "Basic Ideas on Post-evaluation				
Solutions	of PFI Projects" published by national government in FY2023 for PFI				
	promotion.				
	Based on the results of the evaluation, the Agency will also proceed				
	with a study to establish the next management format, taking into				
	account the issues that have arisen in operating the current project.				
	Based on the results of the ex-post evaluation, to be conducted in				
	FY2023, the Agency will study the most appropriate management
